Project Title

To-Do-List Web Application

Introduction

The To-Do-List Web Application is a simple and interactive task management system developed using HTML, CSS, and JavaScript. The project helps users add, manage, and remove daily tasks efficiently.

Objective

The main objective of this project is to create a dynamic task management application using front-end web technologies. It helps in understanding DOM manipulation and event handling in JavaScript. We can add and remove tasks easily.

Technologies Used

The project is developed using HTML5 for webpage structure, CSS3 for styling and layout, and JavaScript for functionality and interactivity.

Features

The application allows users to add new tasks dynamically through the input field. Users can remove

tasks using the delete button provided beside each task.

Working

When the application loads, the user can enter a task into the input field. After clicking the Add button, the task is displayed in the task list section dynamically using JavaScript. Each task contains a delete button that removes the task from the list when clicked. The application updates the task list instantly without reloading the webpage.

Advantages

1. The project helps users organize and manage daily activities effectively.
2. It improves JavaScript programming concepts such as DOM manipulation and event handling.

Conclusion

The To-Do List Web Application was successfully developed using HTML, CSS and JavaScript technologies.
